

## Recommended Exercise Reflection Guide

Use this guide after completing a recommended exercise in this course.

This guide provides a strong example you can use to assess and improve your own response.

Your response does not need to use the exact same wording. Use the guide to check whether your answer is specific, grounded in the customer or workflow context, and clear about the reasoning behind your decisions.

# Assess and Improve Your Activation Review Note

## Recommended exercise recap

In this exercise, you reviewed the Churchill Manufacturing activation scenario.

Churchill activated an approved workflow for regional operations managers. The workflow helps managers create human-reviewed summaries of internal procedures using approved SOP documents and operational policy guidance.

You created a short activation review note. Use the table below to check whether your response considers the most important parts of the exercise. Your wording and structure may differ.

| Output                | What your response should capture                         |
|-----------------------|-----------------------------------------------------------|
| Planned activation    | What Churchill expected to happen during activation       |
| Observed activity     | What actually happened during the first activation period |
| Positive indicators   | Evidence that activation is beginning to work             |
| Issues or concerns    | Evidence that needs attention before the next decision    |
| Open questions        | Questions the deployment team should clarify              |
| Recommended follow-up | Practical next steps before a broader recommendation      |

## Assess your response

Review the example below, then compare it with your own response. The goal is not to copy the wording. The goal is to assess whether your answer separates planned activation from observed activity and identifies what the evidence means for the next deployment decision.

As you review the example, pay attention to three things:

- **Evidence separation.** The response distinguishes the activation plan from what actually happened.
- **Workflow grounding.** The response stays focused on the procedure-summary workflow, not general ChatGPT activity.

- **Actionability.** The response identifies follow-up actions that address source guidance, support routing, and review evidence.

## **Example response: Activation review note**

### **Planned activation**

Churchill Manufacturing planned to activate the procedure-summary workflow with 60 regional operations managers. The workflow was intended to help managers create human-reviewed summaries of internal procedures using approved SOP documents and operational policy guidance.

The activation plan expected at least 45 users to attend enablement, at least 35 users to complete one procedure-summary workflow during the first two weeks, managers to review a sample of generated summaries, champions to collect feedback through a shared support channel, and source, access, or review issues to be escalated to the deployment owner.

### **Observed activity**

Enablement attendance was strong, with 52 users attending. First-use completion also met the plan, with 39 users completing at least one procedure-summary workflow.

Managers reviewed 12 generated summaries and found 9 useful with light edits. However, only 24 users used the approved SOP source guidance. Users also asked repeated questions about which SOPs were approved, and several questions appeared in private messages instead of the shared support channel.

### **Positive indicators**

The intended user group is participating. Enablement attendance exceeded the expected threshold, and first-use completion also exceeded the planned target.

Manager review suggests that the workflow can produce useful outputs when users follow the approved source guidance. The request to consider safety incident summaries also suggests stakeholder interest in adjacent workflow opportunities.

### **Issues or concerns**

Source-use behavior needs attention. Only 24 users used the approved SOP source guidance, and repeated questions about approved SOPs suggest that the guidance may not be clear enough.

The support route also needs reinforcement. Some feedback and questions are appearing in private messages instead of the shared support channel, which makes it harder for the deployment team to see patterns and act on them.

### **Open questions**

Which SOP documents are approved for this workflow?

Why are users bypassing the shared support channel?

Are champions clear on how to route source-use, access, or review questions to the deployment owner?

Should the safety incident summary request be treated as an expansion candidate, or does it require separate readiness and governance review?

### **Recommended follow-up**

Clarify the approved SOP source set, update the workflow guidance, and reinforce use of the shared support channel.

Ask champions to route source-use questions and private-message patterns to the deployment owner. Review another sample of summaries after the source guidance is clarified before making a broader expansion recommendation.

### **Why this example is strong**

This example starts with the activation plan before interpreting the results. That matters because activation review should compare expected activity with observed activity rather than jump directly to a recommendation.

The response uses evidence carefully. It recognizes strong enablement attendance and first-use completion as positive indicators, but it does not treat them as proof that the workflow is ready to expand.

The issues are specific enough to act on. “Users are confused” would be too vague. This response identifies source-use confusion and support-channel bypassing as the issues that need follow-up.

The recommendation is practical. It does not pause the whole workflow or recommend expansion immediately. It suggests clarifying sources, reinforcing support routing, and reviewing more evidence before the next decision.

### **Reflect on your own response**

Compare your response with the example.

Ask yourself:

- Did I stay anchored in the approved workflow and customer scenario?
- Did I use specific evidence rather than general impressions?
- Did I separate what the evidence shows from what remains uncertain?
- Did I avoid treating early or directional evidence as final proof?

- Did I identify the issue, risk, or open question that most affects the next decision?
- Did I make the next step clear enough for a partner or customer team to act on?

If your response mostly describes observations, refine it so the evidence leads to a clear interpretation, practical next step, and responsible deployment recommendation.
