

Recommended Exercise Reflection Guide

Use this guide after completing a recommended exercise in this course.

This guide provides a strong example you can use to assess and improve your own response.

Your response does not need to use the exact same wording. Use the guide to check whether your answer is specific, grounded in the customer or workflow context, and clear about the reasoning behind your decisions.

Assess and Improve Your AI-native Engineering Workflow Recommendation

Recommended exercise recap

In the recommended exercise **Create an AI-native engineering workflow recommendation**, Rocco Labs needs to recommend how Cavendish Cables should introduce Codex collaboration into developer workflows without weakening engineering ownership, validation, or review quality.

Your task is to complete Sections 13–15 of the companion worksheet: **Governance and operating boundaries**, **Expansion evidence**, and **Recommendation summary**.

Use your earlier decisions to define the approved boundary, restricted actions, approval requirements, visibility needs, expansion evidence, and final recommendation summary.

Area	What to define
Approved boundary	Where the first workflow should start.
Restricted actions	What Codex must not do.
Approval requirements	Where human review or approval is required.
Visibility or traceability needs	What should remain inspectable after the workflow runs.
Expansion evidence	What would justify expanding to another repository, team, or workflow.
Recommendation summary	The concise recommendation Rocco Labs should give Cavendish Cables.

Assess your response

Review the example below, then compare it with your own response. The goal is not to copy the wording. The goal is to assess whether your recommendation connects workflow friction, collaboration pattern, human ownership, controls, and expansion evidence.

As you review the example, pay attention to three things:

- **The first workflow is bounded.** The recommendation starts with one selected workflow and one selected repository.

- **Human ownership is preserved.** Engineers and reviewers retain approval, merge decisions, release decisions, risk acceptance, and accountability.
- **Expansion is evidence-based.** The recommendation does not expand just because the pilot feels promising.

Worksheet section	Example response
Approved boundary	Start with pull-request review preparation in one selected repository, using approved pull-request context, changed files, test output, and review expectations.
Restricted actions	Codex must not approve pull requests, merge code, make production release decisions, modify unrelated files, or expand scope without review.
Approval requirements	Human review is required before acting on the summary, accepting changes, merging, or expanding the workflow to additional repositories or delegated investigation.
Visibility or traceability needs	The pull-request summary, files inspected, validation evidence, missing evidence, reviewer questions, reviewer decision, and escalation notes should remain visible.
Evidence that would support expansion	Outputs are useful to reviewers, validation evidence is consistently returned, human review ownership is clear, restricted actions are respected, and context continuity improves.
Evidence that would suggest pausing or refining	Reviewers still need to reconstruct Codex's work, validation evidence is missing, ownership is unclear, or the workflow expands beyond approved boundaries.
Recommended next workflow, if expansion is justified	Recurring CI investigation may be prepared next if logs, command boundaries, repository scope, validation expectations, and review ownership are defined.

Example recommendation summary

Rocco Labs recommends using Codex for interactive debugging support and governed pull-request review preparation because Cavendish Cables is losing time through repeated review delays, fragmented context, and inconsistent validation evidence.

The first delegated workflow should focus on pull-request review preparation for one selected repository. Codex should summarize implementation intent, changed files, validation evidence, missing evidence, and reviewer questions, while engineers retain

approval, merge decisions, architectural judgment, risk acceptance, and accountability for outcomes.

This example uses local review preparation. If Cavendish Cables instead selects native GitHub code review, the recommendation should name the @codex review or automatic-review trigger, the applicable AGENTS.md guidance, the configured repository boundary, and the human reviewer who retains approval and merge decisions.

Recurring CI investigation may be a second delegation candidate if logs, command boundaries, repository scope, validation expectations, and review ownership are defined.

Production deployment approval should remain human-led until approval paths, escalation procedures, and operational controls are established.

Expansion should depend on evidence that Codex outputs are useful, reviewable, validated, governed, and improving context continuity across the workflow.

Why this example is strong

This example is strong because it consolidates the course decisions into one practical recommendation.

It starts with a bounded workflow: pull-request review preparation in one selected repository. That makes the recommendation more realistic than a broad rollout across every engineering workflow.

It also makes restricted actions explicit. Codex must not approve pull requests, merge code, make production release decisions, modify unrelated files, or expand scope without review. This keeps collaboration useful without weakening engineering ownership.

The example preserves human accountability. Codex prepares evidence, but engineers and reviewers retain approval, merge decisions, architectural judgment, risk acceptance, and accountability for outcomes.

The strongest part of the example is the expansion logic. Recurring CI investigation is identified as a possible next workflow, but only if logs, command boundaries, repository scope, validation expectations, and review ownership are defined. Expansion depends on evidence, not enthusiasm alone.

Reflect on your own response

Compare your response with the example.

Ask yourself:

- Did I start with a bounded first workflow rather than a broad rollout?
- Did I explain why that workflow is a good fit for Codex collaboration?
- Did I define what Codex may support and what it must not do?
- Did I keep approval, merge decisions, production release decisions, risk acceptance, and accountability human-owned?
- Did I identify what should remain visible or traceable?
- Did I define evidence that would support expansion?
- Did I define evidence that would suggest pausing or refining?
- Did I identify a realistic next workflow only if readiness conditions are met?
- Did I avoid positioning Codex as uncontrolled automation?

If your answer is unclear, refine the approved boundary, restricted actions, human ownership, visibility needs, or expansion evidence before using the recommendation in a customer conversation.
